

What's in a cannabis strain?

Understanding the chemical composition of cannabis strains is the best way to learn how to find the type of cannabis that will most reliably produce your desired effects.

Cannabinoids and **terpenes** are two types of compounds that occur naturally in cannabis and help predict how you might feel when you consume a strain.

THC and **CBD** are the two most common cannabinoids found in cannabis products.

Terpenes are natural oils found in many plants, including cannabis. They play a key role in shaping the aroma and effects that cannabis strains have.

You can expect similar experiences with similar-looking strains. If you like long, yellow diamonds, you'll like other strains like that.

More CBD

Balanced

More THC
