

## Press Kit

### Holochain Brief

Holochain is an open-source framework for creating peer-to-peer applications that are secure, reliable, and fast. Instead of depending on servers, Holochain applications connect user devices directly to each other in secure networks. This gives users the best of both worlds — the autonomy and availability of locally installed software, with the power and redundancy of cloud software. Application developers, in turn, no longer have to maintain and pay for cloud hosting.

### Holochain Tech

- **Beyond Blockchain:** Self-owned data, distributed database, and peer accountability
- **Made for everyday apps:** Lightweight, secure, versatile
- **Proven tech mashup:** Think BitTorrent + Git + Cryptographic Signatures

### Holochain & Holo

Holo Ltd. is a cloud hosting company that is fully owned by the Holochain Foundation. Holo is responsible for the components of the Holo network, HoloPorts, HoloFuel, HOT, and the Holo hosting apps necessary for creating a distributed cloud hosting marketplace for P2P apps. Holochain is the end-to-end framework for building P2P applications. Holochain is a distinctly Open Source project with related intellectual property residing in the Foundation.
